Abstract

Geomorphological, sedimentological and geochronological analyses have been undertaken to decipher the effects of Quaternary environmental change on the development of the Rio Bergantes, Ebro basin, northeast Spain. Field mapping and profiling utilising large-scale aerial photography and airborne LiDAR data has identified a sequence of six river terraces. Age control, provided by luminescence dating methods, has revealed two major phases of valley floor aggradation at ~ 183 - 130 ka (Terrace BT1, elevated ~ 25 m above the modern river channel) and ~ 111-26.8 ka (BT2, ~ 18-20 m), punctuated by ~ 20 m of incision in the intervening period. Following these two phases of large-scale aggradation, the Bergantes river system adjusted to a more sediment limited regime and responded to environmental changes through a series of smaller cut and fill cycles. This resulted in four lower elevation terraces (BT3-BT6) inset within the older (BT1 and BT2) valley fills. These lower terraces have been temporally constrained at ~ 24.5-14.2 ka (BT3); 10.6-9.8 ka (BT4); 8.3-6.2 ka (BT5) and ~ 3 ka (BT5). Field sedimentological and stratigraphic analysis of the alluvial fills, combined with sediment storage and export calculations, indicates the large influence of tributary and hillslope derived sediment supply during the aggradation of BT1 and, to a lesser extent BT2. This contrasts with the predominantly trunk river derived deposits which make up the fill of BT3-BT6, when the hillslopes and tributaries in the study area appear to be relatively de-coupled with the trunk river. A lack of lithological variation in the Bergantes catchment, combined with large amounts of carbonate, has restricted the possibility of deciphering any spatial or temporal changes in sediment source areas. However, a new and innovative methodology has been designed and implemented which calculates automatic sedimentary section-scale grain size measurements from Terrestrial Laser Scan (TLS) data. This methodology can now be applied to other ancient fluvial sedimentary successions.

Data presented in this thesis suggest that the Bergantes river system has responded to, and has preserved, a record of environmental changes operating both in sync with, and at higher frequency than Milankovitch-driven glacial-interglacial cycles. Major valley floor aggradation phases (or those associated with relatively large amounts of fluvial sediment e.g. BT1 and BT2) correlate with Pleistocene glacial conditions in MIS 6 and MIS 5, when the climate on the Iberian Peninsula was cool and dry. Intervening phases of major valley incision appear to coincide with warmer and moister climates in Pleistocene interglacials. The younger terraces (BT3-BT6) are characterised by much smaller amounts of fluvial sediment. Dating control suggests that their development correlates with stadial (aggradation) and interstadial (incision) events during the Late Pleistocene and Holocene. Many phases of aggradation appear to coincide with the North Atlantic Heinrich Events, which are also recorded in marine cores off the west coast of the Iberian Peninsula, and also to other securely dated phases of aggradation elsewhere in the Mediterranean basin.

Acknowledgements

I extend thanks to my supervisors, Prof. M.G. Macklin and Dr. P.A. Brewer, for their help and guidance over the course of my PhD research. I am particularly grateful to have been given the opportunity to work on a fascinating river system, and for the chance to use some of the most up-to-date techniques in the fields of geomorphology, sedimentology and geochronology. Many other academics have played a very important role during my PhD. I am indebted to Dr. E. Maher (now Whitfield!) for endless discussions on long-term river system development and for the great amount of help she has given me in the shaping of this thesis – I couldn't have done it without you! Similarly, I would also like to thank Dr. J. Brasington for his technical expertise and help with all things LiDAR and TLS. Fruitful work-related discussions, sometimes in the presence of a beer or two (!), are also gratefully acknowledged to Dr. S. Tooth, Prof. G.A.T. Duller, Prof. A.M. Harvey, Dr. A.E. Mather, Dr. R.C. Chiverell, Prof. A.J. Plater, Prof. G.C. Nanson and Prof. D. Maddy. Special thanks are also extended to Prof. A. Lang and Dr. B. Mauz for providing me with the opportunity to use OSL, and to the staff and postgraduates of the Department of Geography, University of Liverpool, for the huge amount of help given to me.

To my best work-mates, Hywel, Ian and Katharine, thanks for always being there for me – I've got some great memories from the past few years! Also, to the many other friends in Aberystwyth, Liverpool and Morpeth (you all know who you are, and there's too many to mention!), thanks for your encouragement and good humour. Thank you also to my current work colleagues at Envirolink Northwest, who have made my move from academia to industry an enjoyable experience.

On a more serious note, I would like to thank my wife, Liz, for her ongoing love, encouragement, help and support, without which I don't know what I would have done... Similarly, my Mam and Dad, Nana, Grandad and Grandma have never faltered with their love and support, and have always encouraged me to pursue my interests. The Maher's and the Jackson's also deserve a big thank you, largely for keeping me sane (although this is open to interpretation...) over the past few years!

Distance axes are standardised to demonstrate relative changes in valley width. All height data were extracted at a 2 m sampling resolution from bare-earth LiDAR (see Chapter 4)._____	113
Figure 6.7: Valley cross-sections demonstrating the morphology and terrace sequence of Reach B (see Figure 6.5 for exact locations). Bedrock straths are underlined in grey. Distance axes are standardised to demonstrate relative changes in valley width. All height data were extracted at a 2 m sampling resolution from bare-earth LiDAR (see Chapter 4)._____	114
Figure 6.8: Valley cross-sections demonstrating the morphology and terrace sequence of Reach C (see Figure 6.5 for exact locations). Dashed lines indicate the approximate terrace surface height where it has been quarried. Distance axes are standardised to demonstrate relative changes in valley width. All height data were extracted at a 2 m sampling resolution from bare-earth LiDAR (see Chapter 4)._____	115
Figure 6.9: BT1 surface on the west side of Reach A. Trunk river flow is towards the camera._____	116
Figure 6.10: Looking upstream (south) in Reach B. Tributary-derived BT1 merging into the Bergantes valley axis from the east. Note the difference in colour between the tributary sediments exposed in section (orange-pink) and those of the modern trunk river (grey-white). Trunk river flow is from left to right._____	117
Figure 6.11: BT2 (indicated) 18 m above the elevation of the modern channel at valley km 0.6. Trunk river flow is away from the camera._____	118
Figure 6.12: BT2 (indicated) 19 m above the elevation of the modern channel at valley km 1.5. Flow is from right to left and has dissected steeply dipping (32°; downstream) Cretaceous limestone, visible in the centre of the photograph._____	119
Figure 6.13: BT2 (indicated) 19 m above the elevation of the modern channel on the west side of Reach B, exposed by active gravel mining. Trunk river flow is from left to right. Width of view in the photograph is ~ 200 m._____	120
Figure 6.14: Looking down-valley at BT3 in Reach C. The lower level (with grass) is a quarried BT6 surface (the true height of this terrace is indicated on the far right of the photograph)_____	121

- Figure 6.15:** BT4 on the east side of Reach A at valley km 2.8. The terrace surface is indicated by the dashed white line. Flow is towards the camera. _____ **123**
- Figure 6.16:** Staircase of BT1-4 on the west side of the valley, as the Bergantes emerges from bedrock control into the wider valley setting of Reach B. Flow is from left to right across the photograph _____ **123**
- Figure 6.17:** Looking north-west across the upstream zone of Reach C as the valley widens following. Trunk river flow is left to right. BT5 is the lowest level visible, followed by BT3 and BT2, and a tributary fan (of equivalent height to BT1). The Guadalupe valley can be seen in the far background, running left to right across the photograph _____ **124**
- Figure 6.18:** Looking west across Reach B. BT6 is the lowest level visible, followed by BT 5, BT3 and BT2 as indicated. Trunk river flow is from right to left. _____ **125**
- Figure 6.19:** Location and orientation of the sedimentary sections analysed and referred to in the text in the context of the valley geomorphology.
- Figure 6.20:** (A) 10 m thick fill underlying BT1 at Location S1, with (B) equivalent sedimentary log (location of the log is indicated by the red line on A; for key see Figure 6.22). _____ **128**
- Figure 6.21:** Trunk river gravels (grey-white) ~ 23-24.5 m above the modern channel, which cap the lower, tributary-derived unit (orange) at Location S2. _____ **128**
- Figure 6.22:** 10 m thick fill of BT1 at Location S4. (A) Sedimentary log, (B1) photograph of section and (B2) sedimentary sketch. (C) Zoomed photograph/sketch of the architecture of the 0-2 m gravel unit. See also the same three units exposed at Location S3 on Figure 6.24. **N.B. Key is applicable to all sedimentary section diagrams.** _____ **129**
- Figure 6.23:** Grain size log of sedimentary section at Location S4 derived from TLS data, presented with respect to height above the modern river channel. Units 1, 2 and 3, as outlined on Figure 6.28 (above), are indicated. _____ **130**
- Figure 6.24:** (A) Sedimentary log of the 22 m thick fill of BT1 at Location S3 with (B) equivalent photograph. (C) Example of the 4-22 m angular to sub-angular gravel unit (pencil for scale is 14 cm). See also the same three units at Location S4 (Figure 6.28). _____ **131**
- Figure 6.25:** (A) Grain size raster derived from TLS data for the deposits underlying BT1 at Location S3 (see also Figure 6.22). (B) Grain size log of the sedimentary section derived from TLS data, presented with respect to height above the modern river channel. Units outlined on Figure 6.24 are indicated (in this case Units 1 and 2, as shown in Figure 6.24, were not accessible for laser scanning due to vegetation obstruction. _____ **132**
- Figure 6.26:** (A) 7 m sedimentary exposure in Gully D at Location S5 with (B) equivalent sedimentary log. Close-up examples of Unit 2 (C) and Unit 1 (D) are also shown (pen for scale is 14 cm). _____ **133**
- Figure 6.27:** (A) Sedimentary log and (B) photograph of the 13 m exposure at the Camino-Bergantes confluence (Location S6) (C) example of the normally-graded bedding. _____ **134**
- Figure 6.28:** (A) Sedimentary log of the 15 m fill of BT2 at Location S7, with (B1) equivalent photograph and (B2) section sketch. Yellow lines relate to unit boundaries and black lines relate to internal unit architecture. Trunk river flow is from right to left. _____ **136**
- Figure 6.29:** Grain size log of sedimentary section at Location S7 derived from TLS data, presented with respect to height above the modern river channel. Units outlined on Figure 6.28 are indicated. _____ **137**

Figure 6.30: (A) Sedimentary log of the fill of BT2 at Location S8i, with optical dating control. (B1) Equivalent photograph and (B2) sketch of part of the sequence. Yellow lines relate to unit boundaries and black lines relate to internal unit architecture. (C) The 0.8 m thick horizontally laminated sand unit (Unit 4; 15-15.8 m up-section)._____138

Figure 6.31: Deposits at Location S8i. (A) Foresets preserved in Unit 1 (notebook is 22 cm) (B) horizontally laminated silty sands of Unit 2 gravels (pen is 14 cm).____139

Figure 6.32: (A) Photograph of 15 m thick sedimentary sequence at Location S8ii with equivalent sedimentary units as identified at Location S8i (N.B. Unit 1 is not exposed). (B) Grain size raster derived from TLS data (C) Grain size log derived from TLS data, presented with respect to height above the modern river channel._____140

Figure 6.33: (A) Sedimentary log with optical dates and facies classification, (B1) photograph and (B2) sketch of the 19 m thick fill of deposits underlying BT2 at Location S10. Unit 1 (0-1.8 m up-section) is also shown (C); the compass-clinometer (indicated by the yellow box) is 7 cm wide._____142

Figure 6.34: Deposits underlying BT2 at Location S9i. (A1) Photograph of exposure with (A2) complementary sketch showing the five sedimentary units (Units 1-5). (B) Sketch showing internal architecture of Unit 1. For grain size and further stratigraphic information derived from this sedimentary section, see the TLS data presented in Figure 6.35._____143

Figure 6.35: (A) Photograph of sedimentary section exposed at Location S9ii (Figure 6.19C). (B) Schematic sketch of the section, identifying Units 2-6 (N.B. Unit 1 of Location S10 is not exposed at this location). (C) Grain-size raster of the section derived from TLS data (Unit numbers are annotated). (D1 and D2) Grain-size logs (locations indicated on C, above) of the section based on TLS data. N.B. Data are presented with respect to height above the modern channel._____146

Figure 6.36: (A) Sedimentary log with optical dates and facies classification of the deposits underlying BT3 at Location S11. (B1; B2) The upper two units of the fill (BT3 deposits) are shown in C (rucksack for scale is 52 cm wide). Thick yellow lines represent unconformities; black lines relate to internal unit architecture._____148

Figure 6.37: (A) Sedimentary log with optical dates and facies classification and (B) photograph of the fill underlying BT3 at Location S12. N.B. Upper date of 16.4 ± 2.8 ka was taken from the same lithostratigraphic unit ~ 1 km downstream._____149

Figure 6.38: Grain size log of sedimentary section at Location S12 derived from TLS method. Data are presented with respect to height above the modern river channel. Units outlined on Figure 6.37 are shown. N.B. Occasional large grain sizes (~ 80-110 mm) are related to [unavoidable] vegetation and weathering of the section face.____150

Figure 6.39: (A) Sedimentary log with optical dates and facies classification, (B1) photograph and (B2) sketch of the deposits underlying BT4 at Location S13. The upper 4.5 m relate to the fill of BT4 and are inset within older (probably BT2) deposits. On B2, yellow lines relate to unconformities and black lines to internal unit architecture. Foresets (DA Element) 5.8-6.5 m up-section is also shown (C) (camera case for scale is 11 cm)._____152

Figure 6.40: Grain size log of sedimentary section at Location S13 derived from TLS method. Data are presented with respect to height above the modern river channel. Units outlined on Figure 6.39 (above) are indicated._____153

Figure 6.41: 4 m thick fill underlying BT4 at Location S14. Partially vegetated sediment at the base of the section is slumped material derived from the exposed sediments._____153

Figure 6.42: (A) Sedimentary log with optical dates and facies classification of the deposits underlying BT5 at Location S15. Two photographs and associated sketches (B1/B2 and C1/C2) are also shown: thick yellow lines relate to unconformities and black lines to internal unit architecture. Trunk river flow is from right to left.	155
Figure 6.43: Sedimentary log and facies classification of the 2.5 m thick fill underlying BT5 at Location S16. Optical dating control of these deposits (Fuller, 1995) is indicated. N.B. no photograph available for these deposits.	156
Figure 6.44: 2.2 m thick fill underlying BT6 at Location S17. Location of OSL sample LV 243 is indicated.	157
Figure 6.45: (A) Sedimentary log with optical dates and facies classification of the ~ 4 m fill of BT6 at Location S18. Equivalent photograph and sketch (B1/B2) are also shown (person for scale is 1.9 m); thick yellow line represents unconformity. (C) Close-up example of the horizontally-laminated sands overlying the lower gravels is shown in C (the highlighted trowel is 16 cm wide).	158
Figure 6.46: Location of tributary and gully systems used to analyse tributary and trunk river interactions. The red boxes refer to the spatial extent of each system analysed.	160
Figure 6.47: Terrace maps of the tributary and gully systems referred to in this section (see also Figure 6.46) from upstream (A) to downstream (C).	161
Figure 6.48: Longitudinal profiles illustrating the character of Group A (large tributaries), Group B (small, steep tributaries) and Group C (gullies) systems, as referred to in the text.	162
Figure 6.49: Longitudinal profile of the lower Torre valley, showing river terraces, the modern channel, and their relationship with the trunk river. Note that there are no trunk river Bergantes terraces preserved at the Torre-Bergantes confluence.	163
Figure 6.50: (A) 13 m thick sedimentary sequence of deposits underlying Torre Terrace 1 at Location S19 (Figure 6.19A) and (B) equivalent sedimentary log.	164
Figure 6.51: (A) 10 m thick sedimentary sequence of the deposits underlying Torre Terrace 2 at Location S20 (Figure 6.19A) and (B) equivalent sedimentary log.	165
Figure 6.52: (A) 3 m thick sedimentary sequence underlying Torre Terrace 4 at Location S21 (Figure 6.19A) and (B) equivalent sedimentary log.	165
Figure 6.53: Looking upstream from the north side of the Cerroch at valley km 1.8. Terrace 4 is the lowest level on the photograph, with the modern channel visible in the far right (centre) of the photograph as indicated. Terraces 1, 2 and 3 are also indicated.	167
Figure 6.54: Longitudinal profile of the lower Cerroch tributary, showing tributary river terraces and their relationship with the trunk river terrace sequence.	167
Figure 6.55: (A) 11.5 m thick sedimentary sequence underlying Cerroch Terrace 2 at the Cerroch-Bergantes junction at Location S21 (Figure 6.19C) and (B) equivalent sedimentary log with facies classifications	169
Figure 6.56: (A) 8 m thick sedimentary sequence underlying Cerroch Terrace 3 at Location S22 (Figure 6.19C). (B) Equivalent sedimentary log with facies classifications.	169
Figure 6.57: (A) 3 m thick sedimentary sequence underlying Cerroch Terrace 4 at Location S23 (Figure 6.19C) with (B) equivalent sedimentary log.	170
Figure 6.58: Longitudinal profile of the lower Valbobera valley, showing river terraces and their relationship with the trunk river terrace sequence.	171
Figure 6.59: Longitudinal profile of the lower Cubeta valley, showing the river terrace and its relationship with the trunk river terrace sequence.	172

Figure 6.60: Longitudinal profile of the lower Espadeta valley, showing river terraces and their relationship with the trunk river terrace sequence.	173
Figure 6.61: Longitudinal profile of the lower Mela valley, showing river terraces and their relationship with the trunk river terrace sequence.	174
Figure 6.62: Longitudinal profile of the lower Camino valley, showing the river terrace and its relationship with the trunk river terrace sequence.	175
Figure 6.63: Longitudinal profile of Gully A, showing the one river terrace exposed by gully erosion, and its relationship with the trunk river terrace sequence.	176
Figure 6.64: Geomorphological map of Gully A and the surrounding area, showing palaeoflow and clast roundness measurements.	176
Figure 6.65: Longitudinal profile of Gully B, showing the main river terrace exposed by gully erosion, and its relationship with the Bergantes trunk river terrace sequence. The red box (BT2) overlapping the terrace profile indicates the location where trunk river deposits become exposed (see text).	177
Figure 6.66: Geomorphological map of Gully B and the surrounding area, indicating palaeoflow and clast roundness measurements as referred to in the text.	178
Figure 6.67: Longitudinal profile of Gully C, showing the river terrace exposed by gully erosion, and its relationship with the trunk river terrace sequence.	179
Figure 6.68: Geomorphological map of Gully C and the surrounding area, indicating palaeoflow and clast roundness measurements as referred to in the text.	179
Figure 6.69: Longitudinal profile of Gully D, showing the river terrace and its relationship with the trunk river terrace sequence.	180
Figure 6.70: Geomorphological map of Gully D and the surrounding area, indicating palaeoflow and clast roundness measurements as referred to in the text.	181
Figure 6.71: LiDAR image (with hillshade and false colouring) of the Guadalope reach at Mas de las Matas. Note the density of agricultural terraces to the west of the modern channel, which flows north-eastwards and can be identified by the 100-200 m strip of riparian vegetation running up the page.	183
Figure 6.72: Geomorphological map of the Bergantes-Guadalope confluence zone (see also longitudinal profile in Figure 6.73, below). Positions A-E relate to the locations of the confluence at different stages in the system evolution, as referred to in the text	184
Figure 6.73: Longitudinal profile of Rio Guadalope extending 5 km upstream of the Bergantes-Guadalope confluence. The 11 terraces (GT1-GT11) identified in this part of the system are plotted together with their proposed equivalent Bergantes river terraces.	185
Figure 6.74: (A) Grain size automation of the fill of BT2 at Location S9ii (and Location S10). (B) Sketch diagram showing the stratigraphy of the section and detailing the six sedimentary units as referred to in the text.	192
Figure 6.75: Total sediment storage volume (km ³) in Reaches A, B and C	195
Figure 6.76: Total sediment storage volume (km ³) for the study reach, based on 200 m sub-reaches (see Chapter 4). Tributary inputs are indicated by the red arrowheads.	195
Figure 6.77: Terrace sediment storage volumes (km ³) through the study reach, based on 200 m sub-reaches. Tributary inputs are indicated by the black arrowheads.	196
Figure 6.78: Terrace sediment storage (km ³) in Reaches A, B and C	196
Figure 6.79: Total terrace sediment storage (km ³) for the study reach	197
Figure 6.80: Sediment gain and loss in the study area associated with each terrace.	199
Figure 6.81: Sediment gain and loss (Reach A) associated with each terrace.	199

- Figure 6.82:** Sediment gain and loss (Reach B) associated with each terrace. _____ **200**
- Figure 6.83:** Sediment gain and loss (Reach C) associated with each terrace. _____ **200**
- Figure 6.84:** Stratigraphy of the fill of BT2 as exposed in sub-reach 19 (normal to the trunk valley axis), based on TLS data. N.B. Unit 1 and the lower part of Unit 2 are not exposed at this location (dashed grey lines). Vertical and horizontal scales are the same. _____ **201**
- Figure 6.85:** Sediment gain and loss as inferred from maximum and preserved thickness data as indicated by the stratigraphy of the BT2 fill at sub-reach 19. _____ **202**
- Figure 7.1:** Schematic cross-sections of the Bergantes fluvial sequence in Reaches A, B, and C. Luminescence dating control (Fuller, 1995; Lopez Aviles, 1998; this study) and sample locations are indicated. _____ **206**
- Figure 7.2:** Three units making up the fill of BT1 at Location S4, as referred to in the text. N.B. The full extent of Unit 3 is not preserved here. _____ **207**
- Figure 7.3:** Sedimentary units making up the fill of BT2 at Location S9i, as referred to in the text. N.B. Unit 1 is not exposed at this location, hence unit numbering begins with Unit 2. _____ **209**
- Figure 7.4:** Simplified cartoon summarising the key stages of development of the Bergantes valley floor as referred to in the text (see also Figure 7.2). _____ **216**
- Figure 7.5:** (A) Summer sea surface temperatures and IRD deposition off the west coast of Iberia during MIS 6. (B) Equivalent IRD deposition during MIS 5-1; (C) Equivalent summer sea surface temperatures during MIS 5-1. After de Abreu et al. (2003) core MD95-2040. **Shading on (B) and (C) indicates the boundaries between the different MIS stages.** _____ **219**
- Figure 7.6:** Results of pollen taxa and marine proxy data (Roucoux et al., 2005) plotted on the GRIP-derived time scale (Johnsen et al., 2001). Dated aggradation episodes in the Bergantes valley (Fuller, 1995; Lopez-Aviles, 1998 and this study) are plotted in purple. Deciduous Quercus requires a moist and warm climate (Jones, 1959); Ericaceae also indicate warmth and of high precipitation (Bannister, 1965, 1966). Pinus shows a strong positive response to offshore temperature changes during MIS 3. Steppe taxa (Artemisia, Chenopodiaceae and Ephedra) indicate arid conditions (Muñoz Sobrino et al., 2001). Heinrich Events are labelled H1 to H6 and the timing of these events is shaded in grey. _____ **222**
- Figure 7.7:** Cartoon demonstrating the relationship between vegetation cover, hillslope-channel coupling and aggradation-incision cycles during typical hydro-climatic conditions on the Iberian Peninsula. **NB This diagram is schematic and does not have a specific vertical or horizontal scale.** Abbreviations used are: MIS (Marine Isotope Stage); HE (Heinrich Event); IP (Iberian Peninsula); GI (Greenland Interstadial). _____ **230**
- Figure 7.8:** Estimated migration of the Bergantes-Guadalupe confluence (Locations A-E as explained in the text). See also Figure 7.9 below. _____ **235**
- Figure 7.9:** Longitudinal profile of the Guadalupe study reach at the Bergantes-Guadalupe confluence (GT = Guadalupe terrace; dashed lines indicate inferred gradients). Diagram shows the height and location of equivalent Bergantes terraces (BT) and the suggested location (and dates) of the former Bergantes confluence (A-E) as shown in Figure 7.8. _____ **236**
- Figure 7.10:** Location of reaches in the Bergantes and Guadalupe basins referred to in the text. A = Bergantes study reach (this project); B = Bergantes-Guadalupe confluence reach (Fuller, 1995; Fuller et al., 1998; Lopez-Aviles et al., 1998; this project); C = Guadalupe Castelseras reach (Macklin and Passmore, 1995; Fuller,

1995; Fuller et al., 1998); D = Cantavieja reach at Forcall (Fuller, 1995; Fuller et al., 1998). The north bank Ebro tributaries referred to in the text (the Gallego and Cinca) are also highlighted. For topography/relief data see Figures 3.1 and 3.2 (Chapter 3).

239

Figure 7.11: Diagram summarising age and height relationships of 41 luminescence dates (Fuller, 1995; Lopez-Aviles, 1998; this study) in four reaches of the Bergantes and Guadalope basins (for locations see Figure 7.10). Phases of dated aggradation and incision are indicated ('?' indicates minimum age where the error range is unknown).

240

Figure 7.12: Cartoon cross-valley sections of the Cinca and Gallego rivers, northern Ebro basin after Santisteban and Schulte (2007). Equivalent age Bergantes terraces (BT1, BT2, and BT3) are indicated by the blue shading.

243

Figure 7.13: Latitudinal plot of dated Late Pleistocene aggradation and incision in Greek, Libyan and Spanish river basins (for references see text) during MIS 5-8. After Macklin et al. (2002).

244

Figure 7.14: Latitudinal plot of dated Late Pleistocene aggradation and incision in Greek, Libyan and Spanish river basins (for references see text) during MIS 1-4. Heinrich Events H1-H6 are indicated (right-left) by the gray shading. After Woodward et al. (2008).

245

Figure A.1.1: Location of OSL samples presented in this thesis in the context of study area geomorphology. For data, see Table A.1.1.

260

Figure A.1.2: (A) Characteristic dose response curve for sample LV 169 (aliquot number 35); dose calibration = 0.0943 Gy s⁻¹. (B) Radial plot for all aliquots used to determine De.

261

Figure A.1.3: Characteristic dose response curve for sample LV 170 (aliquot number 17); dose calibration = 0.0943 Gy s⁻¹. Natural luminescence signal (indicated by the black box on the vertical axis) has exceeded the saturation dose of the sample and, as such, an accurate estimation of De cannot be obtained.

261

Figure A.1.4: (A) Characteristic dose response curve for sample LV 171 (aliquot number 27); dose calibration = 0.0943 Gy s⁻¹. (B) Radial plot for all aliquots used to determine De.

262

Figure A.1.5: Characteristic dose response curve for sample LV 172 (aliquot number 7); dose calibration = 0.0943 Gy s⁻¹. Natural luminescence signal (indicated by the black box on the vertical axis) has exceeded the saturation dose of the sample and, as such, an accurate estimation of De cannot be obtained.

262

Figure A.1.6: Characteristic dose response curve for sample LV 243 (aliquot number 5); dose calibration = 0.0131 Gy s⁻¹. Natural luminescence signal (red) is very low / below the detection limit. Signal to noise ratio in this sample is very low (poor) and, as such, an accurate estimation of De cannot be obtained (in the case of this aliquot 0.12 ± 0.13).

263

Figure A.1.7: (A) Characteristic dose response curve for sample LV 244 (aliquot number 11); dose calibration = 0.13099 Gy s⁻¹. (B) Radial plot for all aliquots used to determine De.

263

Figure A.1.8: (A) Characteristic dose response curve for sample LV 256 (aliquot number 35); dose calibration = 0.0943. Natural luminescence signal (red) is very close to sample saturation (represented by the flattening of the curve); this introduces a significant amount of error into the calculation of De, allowing only a minimum age to be calculated. (B) Radial plot of all aliquots used to determine De.

264

Figure A.1.9: (A) Characteristic dose response curve for sample LV 257 (aliquot number 33); dose calibration = 0.0943. Natural luminescence signal (red) is very close to sample saturation (represented by the flattening of the curve); this introduces a significant amount of error into the calculation of De , allowing only a minimum age to be calculated. (B) Radial plot of all aliquots used to determine De . _____ **264**

Figure A.2.1: Location of IRSL samples (Fuller, 1995; Lopez-Aviles, 1998) used in this thesis, in the context of study area geomorphology. For data, see Table A.2.1. _____ **268**

Figure A.2.2: Stratigraphic context of the IRSL dates of Fuller (1995) from the Bergantes-Guadalupe confluence reach. Terrace nomenclature is from this project; facies nomenclature is from Miall (1996). Sample codes (see Table A.2.1) and locations are highlighted in red. _____ **269**

Figure A.3.1: Relationship between χ_{lf} , SIRM and HIRM for all samples. See Figure A.3.4 for sample locations. _____ **272**

Figure A.3.2: Bivariate relationship between χ_{lf} and SIRM for the full suite of samples encompassing soil, matrix and fine-grained unit deposits from the fill of BT1-6. _____ **273**

Figure A.3.4: Location of sediment provenance samples referred to in Tables A.3.1 A-F and source sediment/lithology samples (Figure A.3.5). Colour coding of the sample numbers indicates the terrace fill from which the sample was taken _____ **274**

Figure A.3.5: Variation in magnetic character (χ_{lf} and SIRM) of eleven source sediment and bedrock samples _____ **277**

Figure A.3.6: Variation in magnetic characteristics of four selected bulk, <1mm - >63 μm , and <63 μm samples. (A) χ_{lf} and (B) SIRM. _____ **279**

Figure A.3.7: (A) Bivariate relationship between Ca and χ_{lf} , (B) Bivariate relationship between Si and χ_{lf} _____ **280**

Figure A.3.8: (A) Bivariate relationship between Ca and SIRM, (B) Bivariate relationship between Si and SIRM _____ **280**

Table 6.3: Summary of Guadalupe terraces (GT) and their equivalent Bergantes terraces (BT), based on height and optical dating control (* indicates dated tributary fan material which underestimates the age of the terrace fill; ** indicates the height of BT3 at the confluence, which is somewhat lower than that upstream of the confluence e.g. as detailed in Table 6.1.2).	190
Table 6.4: Correlation of BT2 sedimentary units at Location H2 (and Location I) and Guadalupe terrace surfaces (** indicates tributary fan deposits which underestimate the age of the terrace)	192
Table 6.5: Maximum, preserved (stored) and exported volume of sediment (km ³) for each terrace, with percentage of exported sediment relative to the maximum volume.	198
Table 6.6: Rates of sediment storage and removal (* indicates dating control inferred from the adjacent Guadalupe valley).	203
Table 7.1: Anthropogenic impact on the landscape of the central Ebro basin. Based on data from Benavente et al. (1991); Davis (1994) and Gutierrez-Elzora and Penna-Monna (1998).	228
Table A.1.1: Summary of OSL dates presented in this thesis. For sample locations see Figure A.1.1. For supporting data see Figures A.1.2 to A.1.10.	259
Table A.2.1: Summary of pre-existing IRSL dates used in this thesis (GT = Guadalupe terrace). For sample locations see Figure A.2.1	266
Table A.2.2: Anomalous fading test ratios (of Fuller, 1995) between initial IRSL measurement (24 hours after preheat) and subsequent IRSL measurements at various intervals (N = natural signal). After Fuller (1995).	269
Table A.3.1 A: Mineral magnetic properties: BT1. Bold indicates >15 χ_{LF} ; >200 SIRM	274
Table A.3.1 B: Mineral magnetic properties: BT2. Bold indicates >15 χ_{LF} ; >200 SIRM	274
Table A.3.1 C: Mineral magnetic properties: BT3. Bold indicates >15 χ_{LF} ; >200 SIRM	275
Table A.3.1 D: Mineral magnetic properties: BT4. Bold indicates >15 χ_{LF} ; >200 SIRM	275
Table A.3.1 E: Mineral magnetic properties: BT5. Bold indicates >15 χ_{LF} ; >200 SIRM	275
Table A.3.1 F: Mineral magnetic properties: BT6.	275
Table A.3.2: Common element concentrations constituting the Bergantes catchment samples (N.B. 1 mg/g = 1000 ppm)	278
Table A.3.3: Summary of bivariate relationships (R ² values) between selected elements and mineral magnetic parameters (see also Tables A.3.1 A-F)	280
Table A.3.4: Minerals and magnetic susceptibility (modified from Dearing, 1999)	281
Table A.4.1: Coordinates of key sedimentary section locations referred to in the text (Spanish National Grid, UTM)	283

List of Acronyms

ka	Kiloannum; unit of time equal to 1000 years
OSL	Optically Stimulated Luminescence
¹⁴ C	Radiocarbon
IRSL	Infrared Stimulated Luminescence
SAR	Single Aliquot Regeneration (Protocol)
MIS	Marine Isotope Stage
OIS	Oxygen Isotope Stage
D-O	Dansgaard-Oeschger (Cycle)
GI	Greenland Interstadial
HE	Heinrich Event
LGM	Last Glacial Maximum
SIRM	Soft Isothermal Remenance Measurements
HIRM	Hard Isothermal Remenance Measurements
GIS	Geographical Information System
LiDAR	Light Detection and Ranging
TLS	Terrestrial Laser Scan(ning)
RMSE	Root mean square error
